

QCPharma™ is the name for a group of products assembled by Access Medical USA from around the world to be the best in each category of quality assurance products offered to the pharmacy community.

The TSB ampoules, vials and bags are manufactured by Cherwell Labs of England. Rather than explain the features and benefits of the Redipor product, we have provided a Cherwell Labs brochure for the Redipor product being distributed by Access Medical USA under the QCPharma™ name.

The components in our kits bear the Redipor name because we felt it would provide continuity and validate the quality of our offering. We felt it was important to retain the Redipor branding so as to disclose the actual manufacturer of the products.

Our surface testing product is manufactured for Palintest of England and imported by Palintest USA for Access Medical USA. Each of our brochures contain usage instructions, incubation instructions and visual samples. The Palintest product was selected because it offered us the ability to provide a test system that is double sided and more sensitive to bacteria, molds and yeasts.

Our packaging is something we are very proud of. We compared the USP <797> guidelines for packaging and found that few if any manufacturers packaged their testing products in a manner compliant with those guidelines. Most package their products on cardboard boxes. That is why our operator test kits contain components that are double packed. First, in impact resistant plastic foam or a plastic bag and then contained in a tamper evident plastic container. Even the labels on the components are printed on plastic and not paper to be free of cellulose fibers. The surface testing paddles are double bagged then boxed for proper entry to the ante room then the clean room/pharmacy.

QCPharma™ blank log sheets are printed on heavy photo paper with a color gradient that “bands” when color copied or scanned and is black and white when photo copied. The log sheets contain a description of the colors and features to be found in an original. The log sheets are supplied only to valid customers of the QCPharma™ product line on request. The blank log sheets from other manufacturers could be copied, downloaded or reproduced without even a purchase of actual testing supplies.

Our next generation of products will focus on testing Large Volume Parenterals, LVP’s, without sacrificing or wasting more than a minimum or any of the product being tested or wasting the target container. Most importantly, they will provide the pharmacy with products, methods and a new level of compliance with USP <797> guidelines for testing LVP’s.

Regards,

Terry Friedrich
